

Project Title: CLI Roguelike Tetris

Overview: This project is a command-line Tetris game with a stage-based progression system and roguelike power-ups. The user clears lines to progress through five stages of increasing difficulty, selecting gameplay modifiers along the way, with an optional endless mode at the end.

Requirements:

1. The Main Menu will provide three options: New Game, Continue (if a save exists), and Leaderboard.
2. The Leaderboard will display scores from previous game sessions.
3. The game screen will display a 10x20 grid, a "Next Piece" preview on the right, a "Held Piece" slot on the left, and current stats (Score, Stage, Falling Speed).
4. Tetrominoes will spawn at the top and fall automatically; the user controls them using: Left/Right arrows (move), Z/X (rotate), Down arrow (soft drop), Space (hard drop), and Left Shift (hold).
5. When a horizontal row is filled, it is cleared, blocks above it drop down, and the user's score increases.
6. To complete a stage, the user must clear a given number of lines (starting from 40). Each new stage increases the falling speed of the pieces and the number of lines needed.
 - a. At the start of each stage, one random "Stage Modifier" is applied that creates a unique challenge.
 - i. Fog of War: The "Next Piece" preview is hidden.
 - ii. Garbage Rise: Every 10 pieces placed, a random incomplete row is added to the bottom.
7. If a new piece cannot be placed because the board is full, the game ends and the score is saved to the leaderboard.
8. Upon clearing a stage, the user is presented with three random power-ups and must choose one (e.g., slower gravity, extra hold slots).
9. A user can only have three active power-ups; if the slots are full, they must replace an existing one or skip the new one.
10. Between stages, the user shall have the option to Save and Quit or proceed to the next stage.
11. After Stage 5, the user may choose to enter "Endless Mode," where difficulty continues to scale indefinitely.
 - a. Stage modifiers will be added as the user clears enough lines. The modifiers will stack on top of each other.

Example Interaction:

The user selects "New Game" from the menu. A 10x20 grid appears. A "T" piece begins falling. The user presses the Right Arrow twice and Space to place it down... After clearing 40 lines, the game pauses and offers three power-ups: "Slow Fall," "Double Points," or "Extra Hold." The user selects "Slow Fall." The game asks "Save and Quit" or "Next Stage." The user selects "Next Stage" and begins Stage 2 with the power-up active and a modifier "Fog of War". After 5 stages, the option of endless mode, save and quit and a new game is given. The user selects endless mode and the game eventually ends.
